

WEBSITE DESIGN

MAKING MY OWN WEBSITE

THE PROCESS

I went through the process of website design by learning to code and using an existing template to create a customized website that showcases my work and personal details. In designing my website, I took into consideration factors such as user experience, visual appeal, and functionality. By altering the code and CSS of the template, I was able to personalize the design and create a unique look for my website.

Furthermore, adding my own icons, photos, and descriptions helped to create a cohesive and professional online presence that accurately reflects my brand and personality. Overall, the website design process allowed me to develop valuable skills in web development and digital design, while also creating a platform to showcase my work and talents to potential clients or employers and professors.

SOFTWARES USED

Let's take a look at the software tools and programs I've used to bring my website to life.

Visual studio

Personally felt that this was more easy to use as a user than notepad or sublime text as it had color coded the code and displayed all the info in one screen

Sublime text

this was also comparatively easir to use than notepad ...however it didnt have everything needed displayed in one screen which led to me switching screens often

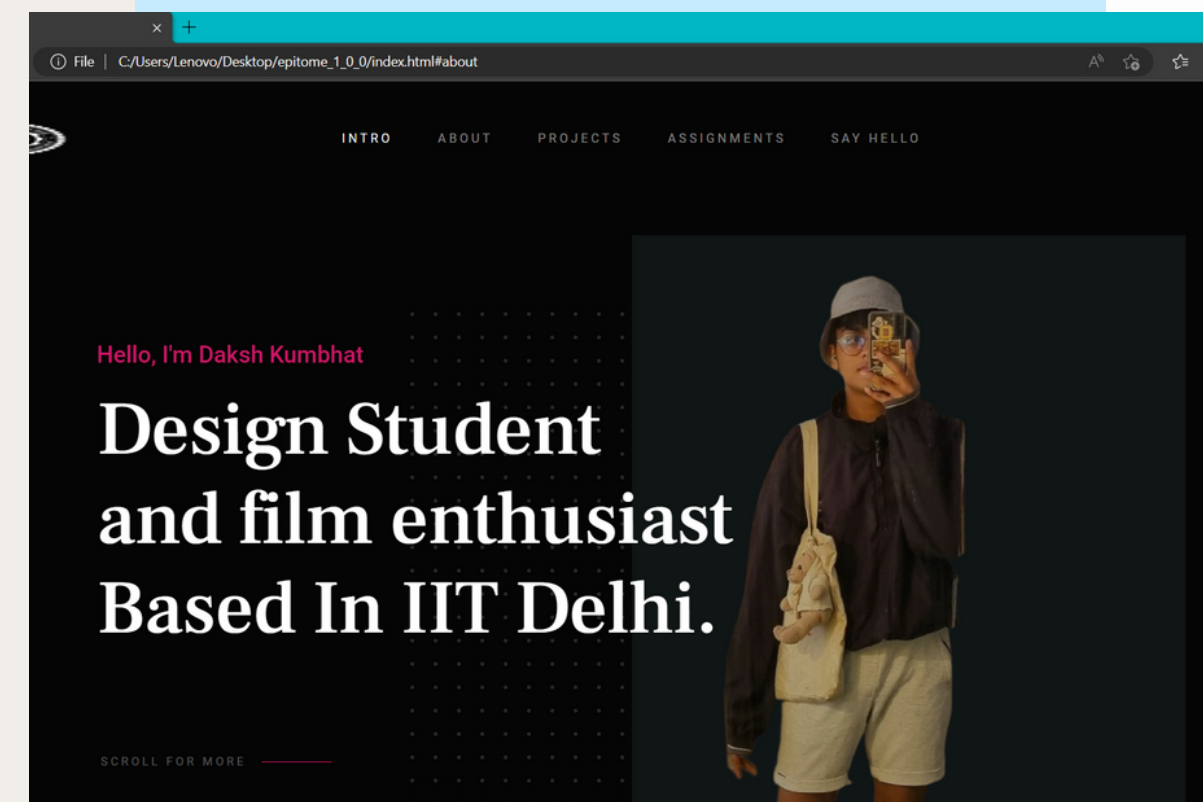

Google Chrome

Used to view the changes in my website based on how I changed the Code

VISION

I envisioned a digital platform that would reflect my unique identity and provide a window into my world of creative projects and professional accomplishments.

I imagined a space that would showcase my skills and personality, while also serving as a hub for connecting with like-minded individuals and potential collaborators. With this vision in mind, I set out to create a website that would be a true reflection of who I am and what I have to offer to the world

PROBLEMS ENCOUNTERED

01 Technical difficulties with coding or website templates

02 Figuring out how css + html are connected and how to edit

03 Difficulty in finding the right balance between personalization and conformity to web design standards

04 Challenges in creating a visually appealing and user-friendly design by myself

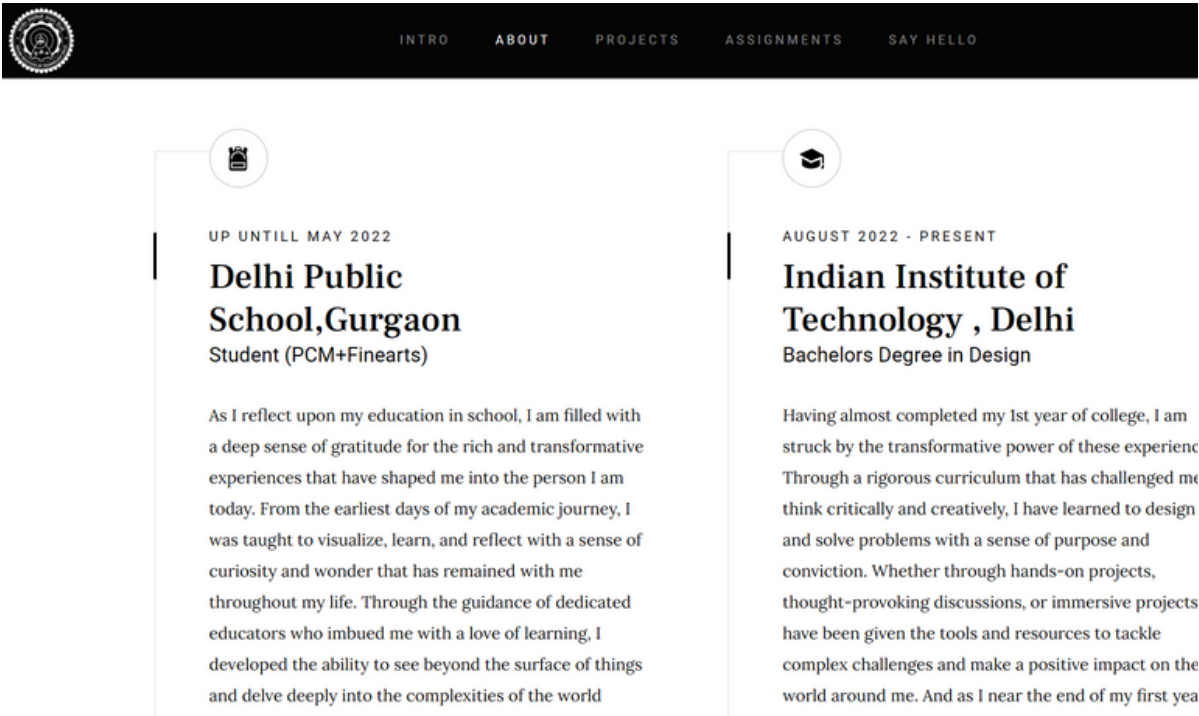

05 Not able to code to get the image dimension in the website correct

06 adding links to photos and making them clickable was a problem i overcame

07 Challenges with third-party tools or plugin

08 Getting the text to overlap the correct way with the image as I want it to be through coding

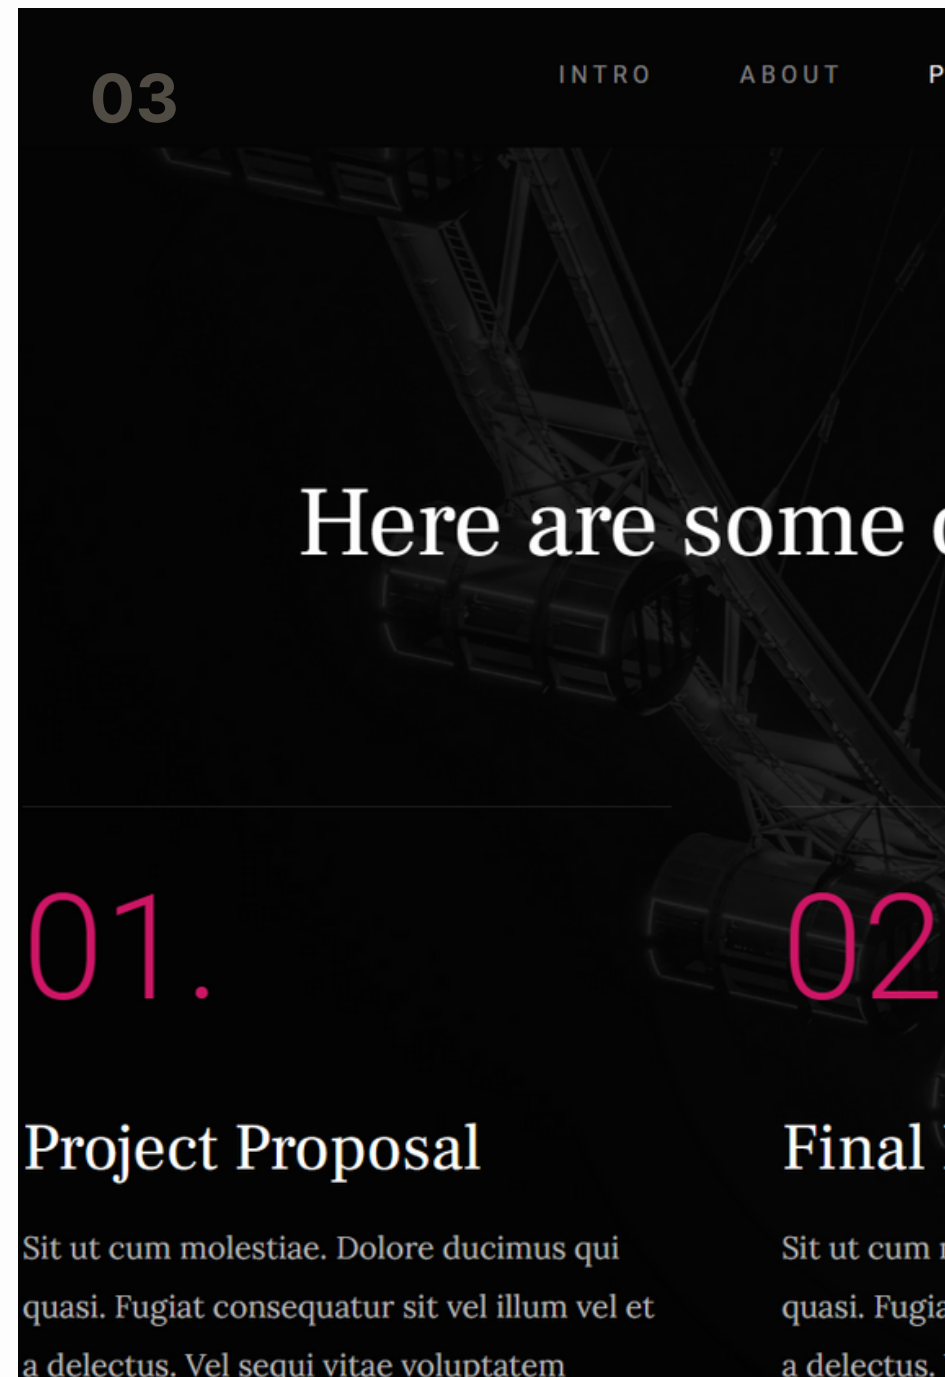

FINAL WEBSITE

01 An Intro page titled about me that introduced me and my personality. It also later has a brief description about my education in school and college and its impact on me

02 The Next title is Projects which will be housing the project that I will be undertaking in this semester and further

- 04** Further I have an assignment tab that houses all my assignments and links for their design process and documentation . I also have a say hello tab that gives all details to be able to contact me
